FLOW OF GENETIC INFORMATION (PRION REPLICATION)

HOW DNA WORKS

The beauty of DNA is that its form is its function. It's a self-reproducing molecule that carries the instructions for making living things from one generation to the next

T-to-G-mutant
(1/14,000)

		mutation	
		T into G	G into T
	rat b	1/14,000	1/3,500
	chick b	1/3,100	1/14,000
		mutation	
		C into T	T into G
	calf a	1/2,100	1/21,000
	chick a	1/2,000	1/110,000

THE SPACE-FILLING SHAPES OF THE FOUR BASE PAIRS OF THE DNA DOUBLE HELIX

(A) **OVERLAID SHAPES -**
4 natural pairs

(B) **CONSENSUS**
POCKET NEEDED

TEMPLATE- BOUND NUCLEOTIDE	FREE NUCLEOTIDES	
	SIZE & SHAPE FIT DNA/POLYMERASE POCKET	SIZE & SHAPE DO NOT FIT DNA/POLYMERASE POCKET
T	A	T, C, G
A	T	A, C, G
C	G	C, T, A
G	C	G, T, A

Figure 3 Geometric characteristics of Watson-Crick and of mismatched base pairs. The figure is based on X-ray crystallography of duplex B-DNA oligonucleotides (reproduced from Ref. 253). The striking geometric identity of the Watson-Crick pairs is not matched by the A-C and G-T wobble pairs or by the G(anti)-A(syn) pair.
